

Software Specification: EPM System (Enterprise Project Management)

1. General Description

The EPM system (“Enterprise Project Management”) is an integrated solution designed to centrally manage projects in large organizations. It enables the planning, execution, monitoring, and control of projects, promoting team collaboration, resource management, and data-driven decision-making.

The platform will be responsive, accessible via modern browsers and mobile devices, and will offer integrations with popular tools such as ERP systems, CRMs, and communication platforms like Microsoft Teams or Slack.

2. System Objectives

- **Centralize Project Management:** Provide a single access point for creating, planning, and controlling organizational projects.
 - **Optimize Resource Usage:** Monitor the allocation of human, financial, and material resources efficiently.
 - **Facilitate Collaboration:** Promote communication and information sharing among teams.
 - **Automate Processes:** Reduce manual workload by automating routine tasks.
 - **Provide Analysis and Reports:** Offer dynamic dashboards and reports to support decision-making.
-

3. Justifications

- **Growing Demand for Management Tools:** Organizations face increasing challenges in project management due to growing complexity and the need for integration among departments.
 - **Productivity Improvement:** Centralizing operations in a single system increases team efficiency and reduces human errors.
 - **Support for Scalability:** As companies grow, a system capable of keeping up with expansion and new requirements is necessary.
 - **Compliance and Transparency:** Promote greater control and traceability of project-related activities.
-

4. Functional Requirements

1. Project Management

- Create, edit, and delete projects.

- Define goals, deliverables, and schedules for each project.
- Track progress based on milestones and completed tasks.

2. Team Management

- Create and manage user profiles (managers, team members, stakeholders).
- Assign roles and permissions based on organizational hierarchy.
- Manage human resource allocation based on availability and skills.

3. Resource Management

- Monitor material and financial resources allocated to projects.
- Automate alerts for resources nearing availability limits.
- Record costs associated with each activity.

4. Collaboration and Communication

- Allow the creation of communication channels per project.
- Integrate with communication tools (e.g., Microsoft Teams, Slack).
- Share documents and files directly through the platform.

5. Monitoring and Reporting

- Provide dashboards with key performance indicators (KPIs).
- Generate detailed reports by project, team, or resource.
- View real-time activity status.

6. Task Automation

- Configure workflows for automatic approvals.
- Send automatic reminders for tasks with imminent deadlines.
- Perform periodic automatic data backups.

7. Integrations

- Connect with ERP systems (SAP, Oracle).
- Synchronize calendars with Google Calendar and Microsoft Outlook.
- Integrate with CRMs for tracking client-related activities.

8. Security and Compliance

- Implement multi-factor authentication (MFA).
 - Track user activity logs.
 - Ensure compliance with regulations (e.g., GDPR, LGPD).
-

This specification provides an initial foundation for the development and deployment of the EPM system, aligning organizational objectives with the required functionalities.
